

Section 7 - Collections, Streams, and Filters Quiz

1.
Why is the builder pattern useful?
2.
Write a simple function to loop over an ArrayList of integers using lambda expressions.
3.
Write another function that takes in the ArrayList of integers from question 2 above and maps each integer to its String representation concatenated with a random letter from the alphabet. Now print out every item in this stream using another lambda expression.
4.
Take the stream from question 3 and filter it so we're only printing Strings that contain the letter "A".
